

USE & SUITABILITY

All RESISTA® elms are robust, healthy, easy-to-care for and undemanding.

Ulmus RESISTA® Rebella generally differs from the other RESISTA® elm varieties due to its leaves and growth character. With its overhanging branches, delicate leaves and a significantly less growth performance, it is also suitable for courtyards and playgrounds, even for small gardens and confined locations.

GROWTH

Rebella develops into a small to medium-sized tree. The delicate open crown and the relatively small leaf give this tree a lively, delicate and elegant character.

Early autumn colouring

LEAVES

The leaves are relatively small and delicate, light green, and about 5 cm long and 2 to 3 cm wide. The strikingly beautiful autumn colouring starts early and produces red to orange-red colours.

FLOWER / FRUIT

The flowers are small and unassuming, seed formation is rare.

SOIL / LOCATION

A sunny to semi-shady location should be chosen. During the establishing phase Rebella needs well-ventilated soil.

HOME / ORIGIN

Cultivar, Ulmus americana x parvifolia

This hybrid was created in the american RESISTA® series by Gene Smalley, Madison Wisconsin 2011.

SPECIAL NOTES

Ulmus RESISTA® Rebella is hardy, wind-resistant, resistant to urban and industrial climates and tolerates both heat and drought.

Leaves up to 5 cm long

RESISTA® elms are not grafted but grow on their own roots. This ensures resistance against fungal infection with Dutch elm disease. Each tree has an implanted microchip, which confirms varietal purity and makes them traceable.
